

Deploy an app test version

Release the connected app to a controlled test environment.

THE FINISHED RESULT

The deployed build signs in correctly, persists data and enforces the same access rules as development.

Before you start

Environment: React + JavaScript + Supabase for the connected path; plain JavaScript local demo

Access and plan: The supplied local demo needs only a browser. The connected path requires Node, a React project, a Supabase development project and approved test accounts.

Practice project: Harbor request board

Use a separate demo project and fictional information. Record the exact project and version you use. Keep passwords, verification codes and private customer information out of screenshots and notes.

Official walkthroughs

Supabase: [React quickstart](#)

Supabase: [React authentication](#)

Open the credited publisher walkthrough for current interface instructions and available screenshots, then return to the SETLY exercise. External courses remain with their publishers; this PDF does not reproduce their complete tutorial.

Your practice task

Finish one action at a time. Inspect the resulting screen or record before moving on. If a control differs, check the matching official instructions instead of guessing.

01 / Step 1

Build the application using its documented package command. Confirm the output uses the development database and intended public configuration.

Check: record what changed and confirm you are still working in the intended demo project.

02 / Step 2

Configure allowed authentication redirects for the exact test hostname. Keep privileged keys in the server environment, never in a public bundle.

Check: record what changed and confirm you are still working in the intended demo project.

03 / Step 3

Deploy to an approved test destination and open it in a fresh signed-out session. Complete sign-in and create one labelled test record.

Check: record what changed and confirm you are still working in the intended demo project.

04 / Step 4

Verify that the same data is available in a second session for the same account, then test account isolation again.

Check: record what changed and confirm you are still working in the intended demo project.

Test, troubleshoot, repeat.

If something goes wrong

If authentication returns to localhost, correct the redirect configuration. If data differs unexpectedly, inspect which backend project the build uses.

If your screen is different

Compare the product, editor, user permissions and selected account with the guide. Open the official reference for your version. Do not perform a live change whose effect you cannot verify.

Final verification

The deployed build signs in correctly, persists data and enforces the same access rules as development.

Repeat the task with one small variation. Record the test date, project/version, expected result, observed result and a non-sensitive evidence reference. Mark skipped checks as untested.

Your evidence record

Test date: _____ Project/version: _____

Observed result: _____

Evidence reference: _____

Remaining issue and next action: _____
