

Test the complete app journey

Verify sign-in, create, edit, reload, delete and sign-out as one flow.

THE FINISHED RESULT

All required transitions work and private records remain inaccessible to other users.

Before you start

Environment: React + JavaScript + Supabase for the connected path; plain JavaScript local demo

Access and plan: The supplied local demo needs only a browser. The connected path requires Node, a React project, a Supabase development project and approved test accounts.

Practice project: Harbor request board

Use a separate demo project and fictional information. Record the exact project and version you use. Keep passwords, verification codes and private customer information out of screenshots and notes.

Official walkthroughs

Supabase: [React authentication](#)

Supabase: [Row Level Security](#)

React: [Learn](#)

Open the credited publisher walkthrough for current interface instructions and available screenshots, then return to the SETLY exercise. External courses remain with their publishers; this PDF does not reproduce their complete tutorial.

Your practice task

Finish one action at a time. Inspect the resulting screen or record before moving on. If a control differs, check the matching official instructions instead of guessing.

01 / Step 1

Write the expected journey using a unique test title so its records can be located later. Record the app version and test account.

Check: record what changed and confirm you are still working in the intended demo project.

02 / Step 2

Sign in, create a request, edit its service, reload and verify the saved values. Delete the record and reload again.

Check: record what changed and confirm you are still working in the intended demo project.

03 / Step 3

Repeat the private-data checks while signed out and as a second user. Test one failed save with the network unavailable.

Check: record what changed and confirm you are still working in the intended demo project.

04 / Step 4

Record each result and clean up only your identified test records. Retest failures after the fix rather than marking the entire journey passed.

Check: record what changed and confirm you are still working in the intended demo project.

Test, troubleshoot, repeat.

If something goes wrong

If isolated screens pass but the full flow fails, inspect session changes, stale cached state and navigation between views.

If your screen is different

Compare the product, editor, user permissions and selected account with the guide. Open the official reference for your version. Do not perform a live change whose effect you cannot verify.

Final verification

All required transitions work and private records remain inaccessible to other users.

Repeat the task with one small variation. Record the test date, project/version, expected result, observed result and a non-sensitive evidence reference. Mark skipped checks as untested.

Your evidence record

Test date: _____ Project/version: _____

Observed result: _____

Evidence reference: _____

Remaining issue and next action: _____

Sources and guide status
